VERDICT

CONSISTENT

0% off — within tolerance.

Clean Filings

The docket above only tests sensitivity — does it catch real restatements. This is the other direction: 152 real claims from 8 large companies confirmed to carry *no* restatement, run through the real Coordinator. 33 consistent, **zero** inconsistent, 119 unverifiable (segment/product detail this resolver's scope doesn't cover). Every ticker is clean.

unverifiable	0

QCOM		TXN	
claims	4	claims	34
consistent	0	consistent	18
inconsistent	0	inconsistent	0
unverifiable	4	unverifiable	16

Zero false positives this run — every resolved claim across all 8 companies checked out.

Fresh Holdout

0/33 proves the fixes behind it work — every one was diagnosed against a bug found *in that same 8-ticker set*. Rerun against a second, disjoint set of large tech companies untouched by any fix this project has made — NOW, PANW, CRWD, WDAY, SNPS, FTNT, INTC, MU — it found something real: **5 inconsistent**, all SNPS, a segment/acquisition sub-figure ("revenues from Ansys of \$756.6 million") mislabeled under the bare "revenue" name. Fixed, and re-run: **3 remain**, all the *same*, already-diagnosed SNPS case — its plain-English "operating income" prose excludes one-time merger costs real GAAP OperatingIncomeLoss doesn't, a structural GAAP/non-GAAP ambiguity left open rather than guessed at.

NOW		PANW		CRWD

SNPS

OPERATING INCOME

“Operating income was \$1.4 billion”

Claimed OperatingIncomeLoss=\$1,400,000,000; EDGAR reports \$914,927,000 for the period ending 2025-10-31 (relative difference 53.02%) — the company’s figure excludes one-time Ansys-merger acquisition costs, real GAAP doesn’t.

SNPS

OPERATING INCOME

“an increase of \$82.5 million”

Claimed OperatingIncomeLoss changed by +\$82,500,000; EDGAR data implies -\$440,784,000 (\$1,355,711,000 -> \$914,927,000), a relative difference of 38.60%.

SNPS

OPERATING INCOME

“or 6%”

Claimed OperatingIncomeLoss growth of +6.00%; EDGAR data implies -32.51%, a difference of 38.51 percentage points.

Reflection

The capstone brief asks for this directly: "a candid reflection on what you learned and what you would do differently." Two things stood out. **Reasoning beat optimization** — switching to ChainOfThought closed nearly the whole gap to a strong extractor; BootstrapFewShot and GEPA added deltas smaller than their own noise floors, and actually hurt on a fresh holdout. **Testing for overfitting finds real bugs, not reassurance** — the clean 0/33 result above hid a real segment-misattribution bug that only the Fresh Holdout run surfaced. With more time: a proper XBRL dimensional parser (most "unverifiable" claims are segment-level, not actually unresolvable), a small classifier for the GAAP/non-GAAP ambiguity CSCO and SNPS both exposed, and a frontier-

model comparison point — every number here was measured against exactly one self-hosted model.

Results shown are real, verified outputs from this project — not a live call.

Full methodology and the complete backtest: see the case study. Every requirement, phase, and hardening pass: see [the field guide](#).
